Overview

Contents

- 1 Overview
- 2-7 Ongoing events
- 8 IDSR Report
- 9 All events currently being monitored

This Weekly Bulletin focuses on public health emergencies occurring in the WHO African region. This week's articles cover:

- Rift Valley Fever in Uganda
- Malaria in Ethiopia
- Cholera in Burundi

For each of these events, a brief description, followed by public health measures implemented and an interpretation of the situation is provided.

A table is provided at the end of the bulletin with information on all new and ongoing public health events currently being monitored in the region, as well as recent events that have been controlled and closed.

Major issues and challenges include:

- Sporadic cases of Rift Valley fever (RVF) have been reported in eight districts of Uganda since January 2023. Currently, only Kakumiro district has an ongoing outbreak. Poor patient seeking behaviours was one of the observed challenges highlighting the need to bolster community-based surveillance and improve community awareness and education. The upcoming El Niño climate phenomenon, predicted by the Uganda National Meteorological Authority to cause above-normal rainfall from October to December 2023, could be a significant exogenous factor in the resurgence of RVF cases. Surveillance activities should be enhanced and maintained to respond appropriately to prevent the spread of the outbreak or any climate-related diseases.
- Ethiopia has been grappling with a malaria outbreak since the beginning of 2023, and numerous regions have reported cases that exceed the epidemic threshold. The regions most severely affected by high incidence rates include Gambela, Southwest Ethiopia Peoples' Region (SWEPR), Afar, and Ahmara. In addition to the malaria outbreak, Ethiopia is also contending with other health crises, including cholera, measles, dengue fever, and the ongoing COVID-19 pandemic. Furthermore, the nation faces a multitude of natural hazards such as droughts, recurring floods, food insecurity, and locust infestations, along with man-made challenges like conflict, internal displacement, and the impact of the Sudan conflict. These combined factors have significantly increased the country's health and humanitarian needs.

Uganda 181 13 7.2% Ungraded cases Deaths CFR Grade

Rift Valley fever

EVENT DESCRIPTION

Rift Valley fever (RVF) outbreaks in humans have mainly been reported from the Western and Central regions of Uganda, mainly within the cattle corridor districts, since the beginning of 2023. From week 1 to week 36 (ending 10 September 2023), a total of 181 suspected cases of RVF including 53 confirmed and 13 deaths (CFR 7.2%) were reported from eight districts; Kabale, Rubanda, Mbarara and Mbarara city, Isingiro, Bushenyi, Nakaseke, Kazo and Kakumiro districts.

During week 36, three districts, including Nakaseke in central Uganda, Mbarara and Kakumiro in western Uganda, were still reporting active RVF outbreaks, with the most recent cases reported in Kakumiro district.

Between 25 August and 10 September 2023, three RVF cases (two confirmed and one probable) and two deaths (CFR 66.7%) were reported from Kakumiro district.

The first case was a 29-year-old butcher from Nkooko town council. He had onset of symptoms of fever, headache, abdominal pain and intense fatigue on 10 August 2023 and on 18 August 2023, he sought medical care at a private clinic where he was referred to the regional referral hospital. He died the same day on his way to the hospital. No sample was collected for testing. The second case was a 36-year-old butcher from Kyolobezi village in Mpasana sub-county, who developed a febrile illness on 11 August 2023. On 16 August 2023, he developed severe nose bleeding and received a symptomatic treatment at home, which was followed with noticeable clinical improvement. A blood specimen collected prior to his death returned positive for RVF by reverse transcription-polymerase chain reaction (RT-PCR) on 25 August 2023.

The third case is a 50-year-old butcher residing from the same subcounty as the second case, who had onset of symptoms on 26 August 2023. On 30 August 2023, he was referred and isolated at a Health Centre III. A blood sample collected returned positive for RVF virus on 4 September 2023.

The common features observed among the three cases are that they all are all animal handlers and presented with similar symptoms, including fever, headache, abdominal and joint pain, as well as intense fatigue. In addition, two cases initially sought care through traditional methods

and one received self-medication at home.

Laboratory testing was performed on collected blood samples at the Uganda Virus Research Institute (UVRI) using the reverse transcription-polymerase chain reaction (RT-PCR) method.

PUBLIC HEALTH ACTIONS

- The District Rapid Response Teams, with support of partner organizations providing technical and financial support, are actively carrying out response activities in the affected districts.
- Uganda runs a routine Viral Haemorrhagic Fever (VHF) surveillance program, where a total of 2 036 samples had been collected by Week 36 (ending 10 September 2023), both from cadavers and alive people.
- Surveillance activities, including ongoing VHF surveillance program in the high-risk districts, active case searching, contact tracing, case investigation, case confirmation are ongoing in the affected districts.
- Risk communication and community sensitization on RVF infection prevention are ongoing in the affected districts.
- Infection Prevention and Control assessment and mentorship is being conducted in health facilities in the affected districts.
- Active animal case search on farms in affected districts is ongoing.

SITUATION INTERPRETATION

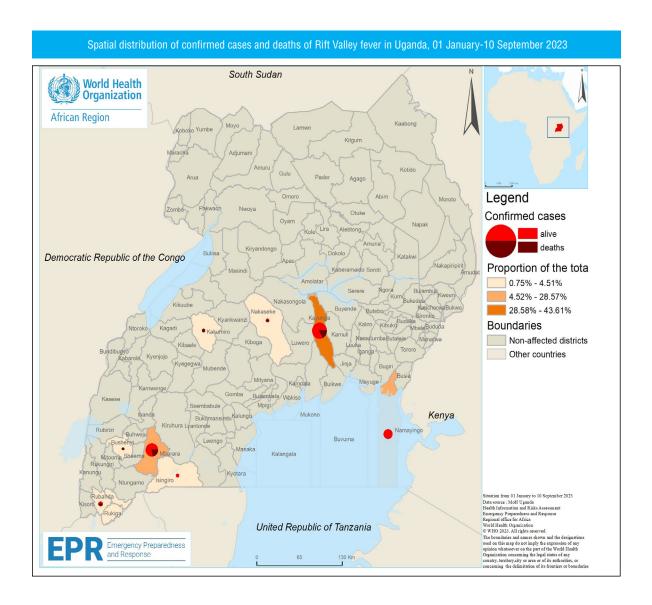

Integrated prevention and control measures that address both human and animal health are to be reinforced to prevent livestock losses and human fatalities and help mitigate the socioeconomic impacts of RVF outbreaks in the country. This includes early reporting and management of animal and human cases, sensitization trainings targeting people at high-risk of exposure during RVF outbreaks, enhanced vector control, preventive animal vaccination, and control of animal movements.

The reported tendency to resort to traditional methods of care or self-medication observed in the last three patients during this outbreak suggests a continuous need to

Go to map of the outbreaks

strengthen and maintain sensitization within the communities.

Uganda has technical capacities for confirming RVF cases, which are a crucial asset for epidemic response activities and should be supported, especially in the context of the ongoing systematic surveillance of VHFs in the country.

Ethiopia

2 235 311

Cases

Malaria

EVENT DESCRIPTION

Since January of this year, Ethiopia has experienced a significant malaria outbreak, with reports from various regions. Four of these regions have reported incidence rates exceeding 2 000 cases per 100 000 population. Gambela has the highest incidence rate at 19 839 cases per 100 000 population, followed by Southwest Ethiopia Peoples' Region (SWEPR) with 8 128 cases per 100 000 population, Afar with 4 511 cases per 100,000 population, and Ahmara with 2 278 cases per 100 000 population. The remaining regions have reported lower rates, with the capital city, Addis Ababa, having the lowest incidence rate at 126 cases per 100 000 population.

During epidemiological week 36 (ending 10 September), a total of 66 377 malaria cases with nine deaths (CFR 0.01%) were reported, a 11.7% decrease compared to the prior epidemiological week 35 (ending 3 September). Of the reported cases, 95.3% were laboratory confirmed, with Plasmodium falciparum being the most prevalent species, accounting for 62.7%. Gambela region had the highest incidence rate, with 684 cases per 100 000 population.

Cumulatively, from 1 January through 10 September, a total of 2 235 311 cases have been reported in Ethiopia. This data is not reflective of cases for week 31 to 36 from Amhara region due to the reported insecurity situation. Excluding September (which has data reported for only one epidemiological week), the average number of cases reported monthly is 271 117 cases. The highest number of cases was reported in June, with 458 369 cases, while the lowest number was reported in March, with 162 453 cases. Oromia region has reported the highest number of cases, 620 131 (28%) nonetheless Gambela region is leading with the highest incidence rate (19 839 cases/100 000 population).

PUBLIC HEALTH ACTIONS

• The Public Health Emergency Response has been activated. Coordination of malaria outbreak response with other vector borne outbreaks is ongoing as well as regular virtual meeting with regions to follow response activities.

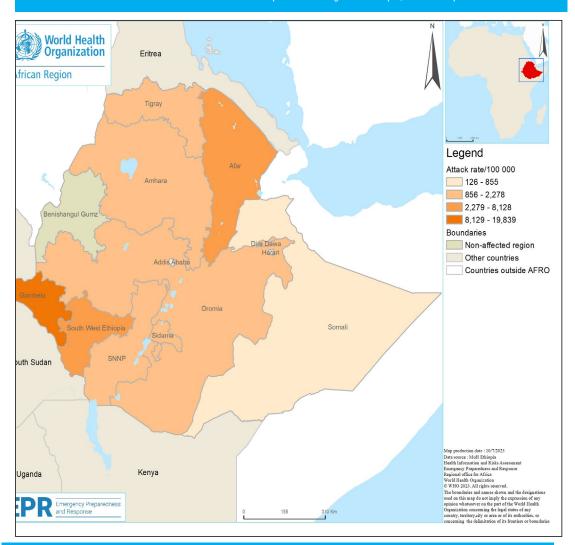

- Regional outbreak response support teams were deployed to all affected regions except Addis Ababa, Harari and Dire-Dawa.
- Regarding cases management, mass fever testing and treatment approaches are conducted in the highly affected woredas and capacity building activities for health care workers at health facility level are ongoing. WHO and partners are supporting with the procurement of medical supplies and logistics to the affected regions.
- Risk communication and community engagement activities are ongoing with key messages on malaria transmission disseminated through local radios.
- Vector breeding site identification and larval source reduction was performed in some high burdened zones and integrated vector control camping conducted in Godey city, Shabelle zone of Somali region.

SITUATION INTERPRETATION

Malaria is endemic in Ethiopia, with higher prevalence in areas below 2000m of altitude, which cover three quarters of the country's land mass, with an estimated population of 52 million. Changes in climate are likely to lengthen the transmission period of major vector-borne diseases including malaria and alter their geographic range. The ongoing malaria outbreak is adding tension on the already fragile health system exhausted by increased demands for responses to other concurrent outbreaks (measles, cholera, covid-19, dengue fever, etc.) and health consequences of natural hazards. Reported challenges to the response include inadequate and limited utilization of insecticide-treated nets, suboptimal environmental or vector control activities, and the presence of various mosquito breeding sites in industrial areas.

Cholera

EVENT DESCRIPTION

The cholera outbreak in Burundi that started in mid-December 2022 continues. In epidemiological week 40 (ending 1 October 2023), eight new cases and zero deaths were reported in three health districts over ten affected districts, namely Isare (n=5), Cibitoke (n=2) and Kabezi (n=1). No new death has been reported since 10 June 2023.

Since our last report (n=574) in weekly bulletin for week 27 (ending 9 July 2023), the number of cases has nearly doubled. Currently, 35 cases are active and followed in Hôpital Prince Régent (HPR) CTC (n=11), Rugombo CTC (n=8), Gatumba CTC (n=13) and Rumonge CTC (n=3).

From the beginning of this outbreak until 1 October 2023, a total of 1 082 cases, including nine deaths (CFR 0.8%) and 1 038 recovered, have been reported from 10 health districts across the country.

The majority of reported cases (80%) have been reported from Rural Bujumbura (n=446) and Bujumbura Mairie (n=409) provinces. Additional cases have been notified from Cibitoke (n=216), Bubanza (n=8), and Rumonge (n=3) provinces. Among the nine reported fatalities, six occurred in Rural Bujumbura, while three were in Bujumbura Mairie provinces. The outbreak is predominantly concentrated in the Isare (n=403), Cibitoke (n=216), and Bujumbura North (n=337) health districts within Rural Bujumbura, Bujumbura Mairie, and Cibitoke provinces.

Males remain more affected than females, constituting 54.5% (n=584) of the cases. Young people between 11 to 20 years old are the most affected, accounting for 22.6% (n=244) of the cases, followed by the 21 to 30 years old age group (21.3%, n=230) and children below five years (18.0%, n=194).

Bujumbura Mairie and Bujumbura Rural districts are particularly recognised as cholera hotspots. These areas encompass the capital city of Burundi, Bujumbura, and its surrounding regions. The high prevalence of overcrowded informal settlements, insufficient sanitation infrastructure, and poor hygiene practices contribute significantly to the transmission of cholera, representing

well-established drivers and risk factors for the disease.

PUBLIC HEALTH ACTIONS

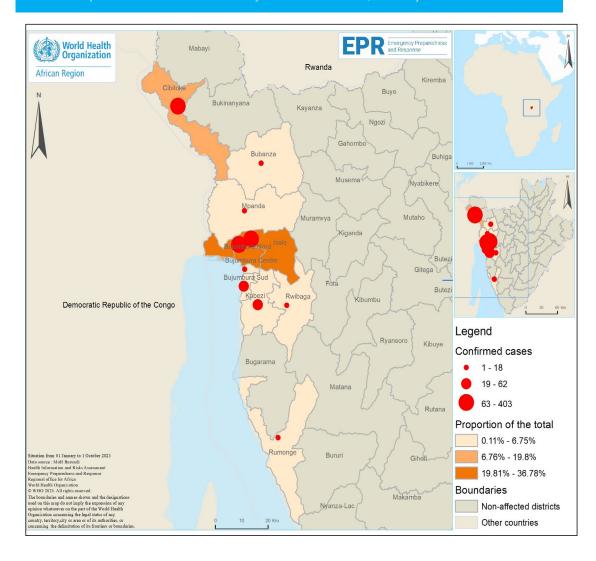

- The Ministry of Public Health of Burundi continues to coordinate response activities to the cholera outbreak with support from WHO and its partners.
- Cholera surveillance activities are routinely performed nationwide, particularly in the affected districts. Health workers have been trained to identify and promptly report any suspected cases of cholera
- Cholera case management is ongoing across several Cholera Treatment Centers (CTCs)
- To enhance case management, Emergency operation center personnel, including doctors and nurses, have been deployed to provide assistance. MSF teams oversee these activities and are responsible for delivering training and offering support in patient care and the WASH component at both Rugombo and HPRC CTCs.
- WHO, UNICEF, and MSF have provided logistic supply (medicines and Wash kits) to Rugombo and HPRC. MSF is supporting with provision of food to hospitalised patients at Rugombo and HPRC CTCs, as well as the staff, to mitigate the risk of Vibrio transmission in the communities
- Water and sanitation activities (WASH), including the distribution of aqua tabs and the supply and installation of water tanks supported by partners, are ongoing in Cibitoke, Isare, and Bujumbura Nord districts. Risk communication and community engagement activities in affected areas to mitigate practices with high risk of cholera infection is ongoing through several awareness-raising activities

SITUATION INTERPRETATION

Burundi is facing a persistent cholera outbreak, exacerbated predominantly by inadequate water and sanitation conditions in affected areas throughout the country. The ongoing challenges related to accessing clean water and the scarcity of latrines continue to be reported, with notable concerns in areas like Kinyinya refugee camp. Recognising the endemic nature of cholera in Burundi, it is crucial to implement long-term solutions that address WASH conditions effectively. Additionally, there is a need to strengthen surveillance, enhance risk communication, and actively engage communities within the affected areas.

Côte d'Ivoire	Food poisoning	Ungraded	9/18/2023	9/20/2023	9/20/2023	72	72	8	11.10%

†Grading is an internal WHO process, based on the Emergency Response Framework. For further information, please see the Emergency Response Framework: http://www.who.int/hac/about/erf/en/.

On September 17th and 18th, a total of 8 deaths were recorded out of 72 cases in a village located in the centre of Cote d'Ivoire near the city of Bouaké, all of which had in common the consumption of a porridge originating from the same source. Children between the age of 0-15 years were mostly affected. No case was reported since 18

Data are taken from the most recently available situation reports sent to WHO AFRO. Numbers are subject to change as the situations are dynamic.
