Contents

- 1 Overview
- 2-7 Ongoing events
- 8 IDSR Report
- 9 All events currently being monitored

This Weekly Bulletin focuses on public health emergencies occurring in the WHO African region. This week's articles cover:

- Rift Valley Fever in Kenya
- Measles in Mauritania
- Lassa Fever in Nigeria

For each of these events, a brief description, followed by public health measures implemented and an interpretation of the situation is provided.

A table is provided at the end of the bulletin with information on all new and ongoing public health events currently being monitored in the region, as well as recent events that have been controlled and closed.

Major issues and challenges include:

- Kenyan health authorities issued an alert on Rift Valley fever (RVF) outbreak on 24 January 2024 following the confirmation of a human case of RVF in Marsabit County. Despite only one confirmed human case, various factors could contribute to the worsening of the outbreak. Recent El Nino rainfalls and flooding may have increased mosquito vectors with the capacity to transmit RVF in endemic areas. The displacement of humans and animals due to late 2023's flooding may lead to aggregation in potential RVF virus amplification areas. Furthermore, underreporting and misdiagnosis of cases could result in underestimating the true burden of the outbreak in Kenya.
- Mauritania's response to the ongoing measles outbreak is hindered by several obstacles. Firstly, the planned measles vaccination campaign from 2023 is still pending, and national administrative vaccination coverage is lacking. The situation is further complicated by multiple border crossing points, hindering disease control efforts. Timely data reporting from crucial healthcare facilities remains a persistent challenge. Limited awareness and outreach efforts on vaccination are observed, especially in remote areas and among special populations. Additionally, the suboptimal functionality of isolation units for suspected cases in health centers aggravates the complexities of the response.

Kenya 13 0 0.0% Cases Deaths CFR

Rift Valley Fever

EVENT DESCRIPTION

On 24 Jan 2024, the Ministry of Health (MoH) of Kenya issued a Rift Valley fever (RVF) alert following confirmation through RT-PCR at CDC laboratory in Nairobi of a human case of RVF from Marsabit County. The confirmed case is a 38-year-old female resident of Shuur location of Turbi ward, Saku Sub- County in Marsabit County. She presented at the outpatient Department of Marsabit County Referral Hospital (MCRH) and was identified through the Acute Febrile Illness surveillance supported by US CDC.

The primary symptom in this index case was fever of 38.7°C, and no other clinical signs were observed. The patient had no underlying health conditions. Important to note is that this confirmed case was among 13 suspected RVF cases reported by the MCRH from 9 to 19 January 2024 from whom 13 blood samples were collected and sent to CDC laboratory in Nairobi for testing and one out 13 (7.7%) samples tested came out positive for RVF.

Recent occurrence of animal deaths in Marsabit and Wajir Counties further support that an outbreak was likely occurring in the areas before the confirmation of the human case. Additionally, between December 2023 and 19 January 2024 there have been reports of suspected RVF cases in livestock in the Mandera, Wajir, Garissa, Marsabit, and Tana River counties. The Department of Veterinary services has also reported serological evidence of both IgG and IgM antibodies in livestock in Garissa, Mandera, Marsabit, Tana River and Wajir counties.

In December 2023, routine RVF surveillance led to collection of 275 animal samples that were submitted for screening at the Regional Veterinary Laboratory. Out of the 275 samples analyzed, 52 were positive for IgG and one sample for IgM signifying active infection within the animal population.

PUBLIC HEALTH ACTIONS

- The Ministry of Health issued a RVF alert to all County Directors of Health highlighting the importance of early detection, laboratory confirmation and management of suspected cases.
- The national and county Emergency Operations Centres have been activated with a functional Incident Management System that have deployed a Rapid Response Teams to conduct rapid assessment of the outbreak in Marsabit and Wajir.
- The national government is working closely with affected county governments with financial and technical support from several partners and WHO to effectively respond to the outbreak.
- County departments of health have started responding to the outbreak by identifying critical and life-threatening gaps, triggering one health multisectoral coordination mechanisms, and reviewing the response interventions.
- Sensitization activities for the community and animal breeders on Rift Valley fever are ongoing.

SITUATION INTERPRETATION

Rift valley fever is endemic in Kenya with recurrent outbreaks in animals and humans reported. The major outbreaks in humans the country experienced was in 1997 with about 89 000 human infections and 170 human deaths reported in Garissa County and Southern Somali. Like other RVF outbreaks reported in Africa, the disease exposure factors frequently identified include but not limited to the breeder profession, the non-use of mosquito nets, contact or manipulation of tissues of suspect animals and the transhumance lifestyle. For the current outbreak, the increased livestock trade due to festive season or as an adaptation to the climate hazards or flooding may have potential to introduce infections in rather naive or healthy animal herds. Low knowledge and lack of awareness on the causes, transmission, clinical symptoms, and management of RVF at the community level are also reported for the current outbreak. There is a need for additional resources to scale up response activities.

Mauritania

Cases	Deaths	CFR

Measles

EVENT DESCRIPTION

The measles outbreak that commenced in 2023 in Mauritania continues with a rising trend. In the last three epidemiological weeks (from week 51, 2023, to week 2, 2024), a total of 187 new suspected cases were reported, including 130 confirmed cases (29 IgM+ and 101 confirmed by epidemiological link), across 10 administrative regions (Moughataas). There is a noticeable increase in trends during the initial weeks of 2024 (week 1 and week 2) compared to the same period in 2023.

From 1 January 2023 to 14 January 2024, the country reported a cumulative total of 1 169 suspected measles cases. Among the 533 samples collected, 281 were confirmed positive for measles based on the presence of IgM antibodies. Additionally, 197 cases were classified as positive by epidemiological links to previously confirmed cases. During this period, eight deaths were reported, including two community deaths, resulting in a lethality rate of 0.7%.

Confirmed cases were notified from 40 Moughataas of 15 Wilayas. The most affected Moughataas are Moudjriya (143 cases per 100 000 inhabitants), Tidjikdja (75 cases per 100 000 inhabitants), Bassiknou (52.7 cases per 100,000 inhabitants), Touil (39.5 cases per 100 000 inhabitants), and Ksar (35.5 cases per 100 000 inhabitants).

Since the beginning of this outbreak, 28 Moughataas have surpassed the epidemic threshold in these 15 provinces (Wilayas), including the three provinces of Nouakchott. Among these 28 Moughataas that have exceeded the epidemic threshold, five are currently experiencing an active epidemic phase, while the remaining 23 have transitioned into the post-epidemic phase.

Data from epidemiological week 52, 2023, to week 2, 2024, reveals a significant attack rate, notably with a high incidence of 38.8 cases per 100 000 inhabitants in the age category less than one year. The age group between 1 and 4 years follows with an attack rate of 13.5 per 100 000 inhabitants, while the age category between 5 and 14 years shows a rate of 8.7 per 100 000 inhabitants. Individuals aged less than 15 years represent 67% of all cases. The gender ratio, female to male, is 1.04. Among children aged 9 to 59 months, 56% have not received vaccinations.

Go to overview

The outbreak of measles in Mauritania can be attributed to a significant number of susceptible individuals, as the latest follow-up measles vaccination campaign dates back to 2018. Additionally, vaccine coverage is low in certain communities, particularly among nomadic populations and those hesitant or resistant to vaccination activities.

PUBLIC HEALTH ACTIONS

- The incident management team is operational at the national level, convening regularly to synchronize response efforts. The elaboration of the response plan for the ongoing outbreak is currently underway.
- Ongoing surveillance activities include epidemiological investigations in affected Moughataas, distribution of case definitions in health facilities and the dissemination of information on Integrated Disease Surveillance and Response procedures during measles outbreaks.
- Ocase management activities including a specialized care service at the Mother and Child Hospital and the provision of a support medication batch at the N'beika Health Center are ongoing. Currently, 59 confirmed cases are being managed in N'beika.
- Ongoing risk communication activities include raising awareness among the population about the importance of vaccinating children. Additionally, home visits are being conducted for families with suspected or confirmed cases.
- Vaccination efforts are underway, including the vaccination of 678 contacts and non-vaccinated children around confirmed cases. Targeted vaccination is also being implemented around cases in specific regions such as Assaba, Tagant, and Trarza.

SITUATION INTERPRETATION

The rise in the number of measles cases in Mauritania is linked mainly to the low vaccination rate and important number of susceptible individuals is very concerning. Immediate actions should be taken to curb this outbreak including the strengthening of the surveillance system,

especially in hospitals, for efficient data reporting, strengthening routine vaccination efforts, improving measles case management (including free healthcare and the availability of vitamin A), and advocating for a nationwide follow-up measles vaccination campaign. Additionally, reinforcing Infection Prevention and Control measures in healthcare facilities, and enhancing coordination at regional and departmental levels are essential.

Nigeria

53 6 11.3% Cases Deaths CFR

Lasser Fever

EVENT DESCRIPTION

The Lassa fever outbreak in Nigeria has seen a significant development in the first epidemiological week of 2024, (1 to 7 January). Comparing the data with the previous year, 2023, there has been an evident increase in both suspected and confirmed cases. In week 4, there were 190 suspected cases and 53 confirmed cases of Lassa Fever, a notable rise from the 143 suspected and 29 confirmed cases in the same period of the previous year.

The reported deaths due to confirmed cases in the first week of 2024 are six, resulting in a Case Fatality Rate (CFR) of 11.3%. This CFR, although significant, is a decrease from the previous year's 27.6% in the same period. The outbreak has spread across nine states, affecting 27 Local Government Areas (LGAs).

The majority of the confirmed cases, about 71% (n=38), are concentrated in three states: Ondo, Edo, and Bauchi. The remaining 29% (n=15) of cases are spread across six other states. Ondo and Edo states each reported 25% (n=13) of the confirmed cases, while Bauchi reported 21% (n=11). The age group most affected by the outbreak is 21-30 years, with a median age of 32 years. The gender distribution among confirmed cases shows a nearly balanced ratio, with a male-to-female ratio of approximately 1:0.9.

PUBLIC HEALTH ACTIONS

In response to the outbreak, the following measures have been implemented:

- Activation of the Incident Management System/Multisectoral Public Health Emergency Operation Centres at the national level and in some affected states.
- Treatment of confirmed cases at designated treatment centers across the affected states.
- Distribution of updated guidelines for case management and safe burial practices.
- Diagnosis of samples in Lassa fever testing laboratories nationwide.
- Dissemination of reports on the preparedness

- survey conducted in the 36 States and the Federal Capital Territory to assess readiness and response to Lassa fever.
- Dissemination of media content, including press releases, tweets, and public advisories.
- Hosting of the first Lassa Fever webinar for 2024, focusing on "Empowering Communities to Combat Lassa Fever."
- Collaboration with the Coalition for Epidemic Preparedness Innovations to enhance the implementation of research activities.
- Provision of off-site support on Infection Prevention and Control (IPC) and safe burial practices to the affected states.
- A team is monitoring of outbreak emergency composite indicators to guide further action.

SITUATION INTERPRETATION

The ongoing Lassa fever outbreak in Nigeria has recently demonstrated a worrying escalation in cases compared to the previous year, underscoring the need for continued vigilance and robust response mechanisms. The concentrated nature of the outbreak in certain states and the demographic profile of those affected indicate specific areas where targeted interventions might be most effective. A multi-faceted approach to responding to the outbreak has been applied, with comprehensive response activities, including case management, dissemination of guidelines, diagnosis improvements, and the emphasis on community empowerment and research. Progressively, it is crucial to maintain and enhance these response efforts, focusing on high-burden areas while ensuring nationwide preparedness. Continued monitoring, and alongside community engagement and awareness campaigns, will be key to controlling the spread of Lassa fever and mitigating its impact in Nigeria.

Go to overview

The Far North region of Cameroon is still facing humanitarian crisis. The region situated at the border area with Nigeria and Chad, as well as the Lake Chad area, reflected by the armed conflict. Between August and September this year, nearly 6 000 newly displaced people were registered in the Mokolo district following repe by non-state armed groups. More than 2 200 new asylum seekers/refugees were registered for the same period at the Gourenguel transit site, in Mokolo district of Tsanaga department. Cameroon Cholera Grade 3 31-Aug-21 25-Oct-21 3-Dec-23 21.222 2.084 508 The cholera outbreak in Cameroon is still ongoing and the outbreak is currently active in 10 districts across three regions (Center, Littoral and South-West). In wee new cases were reported with zero death, this gives a cumulative number of 21 222 cases including 2 084 confirmed by culture (9.8%) and 508 deaths (CFR.2.4% age is 28 years (0.1-103 years) and the MFr ratio of 1.3. Cameroon Measles Ungraded 2-Apr-19 1-Jan-23 3-Dec-23 6.682 6.535 31 From week 1 through week 48 (ending 3 December 2023), 6.535 confirmed measles cases have been reported in Cameroon, including 476 lgM+ and 6 059 epiden linked.
